Product: Oil and Gas Solutions

Oil and Gas Solutions
How CMO Global can assist the Oil and Gas Sector

In the highly competitive and dynamic oil and gas sector, innovative technology solutions can be the difference between profit and loss. To help you stay on top, CMO Global offers a range of cost-effective and efficient wireless communication products.

After researching the current state of the oil and gas industry and discussions with industry experts, we have discovered that the Oil and Gas sector has advanced technology solutions, however in order for companies to improve their operational efficiencies and show some quantitative ROI, companies need to look at mobilising their applications, to streamline business processes and improve workflows of mobile workers. You may have the best databases and applications, however if the information is not accessible to all parties and easily updateable then the benefits are not being fully realised.

CMO Global have identified some key products and services that would benefit you in your daily operations.

CMO Inspector

Filling out paper forms in the field and then manually entering the data upon returning to the office results in delayed information relay, redundant data entry and reduced worker productivity.

CMO recently provided a web based application that can be accessed remotely from handheld PCs to the UK Construction sector. CMO Global's software application allows site inspectors to inspect sites equipped with a personal digital assistant (PDA).

CMO Inspector enables a mobile workforce to accurately and efficiently gather data, such as inspection data or equipment performance readings. Administrators can easily build data collection forms, define data validation rules, and manage the forms. This results in reduced paperwork, greater accountability, efficient management of updates to inspection criteria, and increased data accuracy and timeliness.

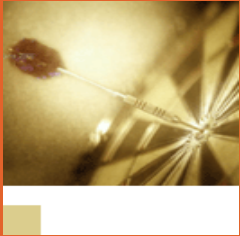

We provide high quality, reasonable rates with far greater personal support than big business alternatives.

CMO Works

Mobile field forces manage valuable assets every day, such as equipment installed onsite or in production or distribution facilities. To improve service levels, repair times, and success of repairs a service technician requires real-time interaction with work order information, such as service level agreements and entitlements, tasks, and equipment configurations. CMO Works helps the coordination and communication of an organization's maintenance and service requirements.

CMO Works allows the following processes to be conducted from a PDA in the field:

Create a New Work Order

√ Record Work Order Information

Update work order status, work performed, actual start and finish times, order new equipment

√ Work Order Management

View/sort/select work orders - view/add customer profile/work order history, outstanding and assigned work orders. Sort by priority, scheduled start time, or field of choice - Display details of work orders, such as priority, location, equipment number, order type, and tasks

√ Order Equipment

Order equipment and schedule procurement

√ Alert Notification - Create customized notifications (email/sms/web)

CMO Works allows more time to be spent fixing machinery and less time filling in paperwork, going to the store room, or looking up equipment information. CMO Works allows emergency, scheduled and predictive work orders to be managed, regardless of location. This allows technicians to ensure that assets, such as production lines, stay running, or are returned to service quickly following a breakdown.

Importantly, management within an organisation also receive better visibility into the performance, productivity, and activities of the maintenance operations. This allows companies to stay competitive by increasing operational efficiency, streamlining communication and work flow, and maximising asset utilization.

high quality web based solutions
and outsourcing options

Other Products currently under R&D:

- Onsite PDA applications for geologists/ engineers which can upload and download data from a central database in real time during inspections, field work, drilling, presentations etc.
- Project management and issue management applications
- Remote Systems to monitor and control mechanical equipment, valves, pumps and signs from a central location using wireless monitoring for malfunctioning and other issues.
- Mobile systems for sales forces
- Web interface solutions for B2B customers to log in and access appropriate information relative to their purchases - this would include advanced functionality which could provide means to monitor their orders, reserves, means to calculate required product based on retail usage, means to calculate potential amount required based on uptake of a particular product

CMO Global are unique as we own our development team and provide all solutions from start to end without need for third party provision. We won't be beaten on price or on service support. If you would like us to revolutionize any of your current business processes with mobile or web based applications integration please contact us.
