## CMO COMPLIANCE - OffsetGo environmental auditing

The recently developed CMO COMPLIANCE Environmental Software application (OffsetGo) enables raw energy usage data to be gathered on site and collated into a convenient report format to allow organizations to save time and money and reduce their carbon footprint.

Key features of OffsetGo include:

- cost benefit analysis of implementing energy efficiency measures
- an accepted 'industry standard' carbon calculator to determine enterprise wide carbon footprint
- easy to interpret graphical representation in the report format
- a web based reporting tool that comes as a complete package enabling clients to compare current and future audit outcomes
- the ability to link to Triple Bottom line
- reporting initiatives and relevant measurable KPI's
- reporting features that can incorporate Corporate Social Responsibility (CSR) outcomes

Key benefits of OffsetGo include:

- Reduction in data transcription errors caused by elimination of off-site data entry
- On-site sign off from clients on the report format at the time of the audit enabling clients to focus on the common goal of the audit report.
- Gain client buy in at the initial audit stage.
- Enabling clients to see that in many cases the cost of an audit pays for itself by the savings generated.
- An ability to pass on Carbon footprint data to a Carbon broker for Carbon offset process.

OffsetGo represents a module of CMO COMPLIANCE from CMO Handheld Software.

CMO COMPLIANCE is a compliance and audit management system enabling organisations to identify and eliminate risks before losses occur. The system is based on a secure web based application, with mobile wireless PDA access.

CMO COMPLIANCE automates the audit process, from inspection to action tracking, giving critical knowledge and control.

Whether for OH&S, QA or data collection, CMO COMPLIANCE simplifies compliance, reduces risk, saves time and money.

Traditionally, field personnel typically visited a site carrying a clipboard, previous data and further support information, such as manuals, to perform an audit. This is inefficient, error-prone and outdated. Given the importance of audit and fieldwork, an alternative was needed!

CMO COMPLIANCE supports any existing forms and templates an organisation may have, and also contains default templates including all aspects of auditing.

With CMO COMPLIANCE enabled on a handheld device, all necessary information including audit templates, reference material and legislation can be integrated onto a user-friendly interface to capture observations. GPS locations and digital images can then be seamlessly uploaded to a central web-based database for reporting (e.g. cradle, wifi, GPRS, 3G).

Once the data is synchronised, CMO COMPLIANCE provides the means to view, manipulate and report on audit data at a micro and macro level, simply through logging onto a secure web-based interface.

CMO Handheld Software has had some major wins including Ohio University, USA, Royal Bank of Scotland, M5 Tollroads, Centennial Coal, Monash University, Bureau Veritas HS&E Ltd and Orica.
